

Getting the Most of WordPress Responsive Images Checklist

- **Upgrade to WordPress 4.4** - If you have not already, you need to upgrade to WordPress 4.4 or later. Otherwise responsive image support will not be included.
- **Regenerate Thumbnails** - Use the “Regenerate Thumbnails” plugin to regenerate the thumbnails for existing images on your site. You only need to do this once.
- **Clear any caches** - Be sure to clear any caches you have set up on the site to ensure the responsive images will be displayed
- **Check image sizes** - Right-click on the image in Chrome and choose Inspect to ensure the image size being served is correct
- **Optimize images** - Beyond responsive images you should still optimize image file size using something like Kraken or WPSmush
